

AGILE OFFROAD™

DTE PedalBox – User Guide

Overview: Programs and fine tuning Over 20 different possible combinations

First, choose your program

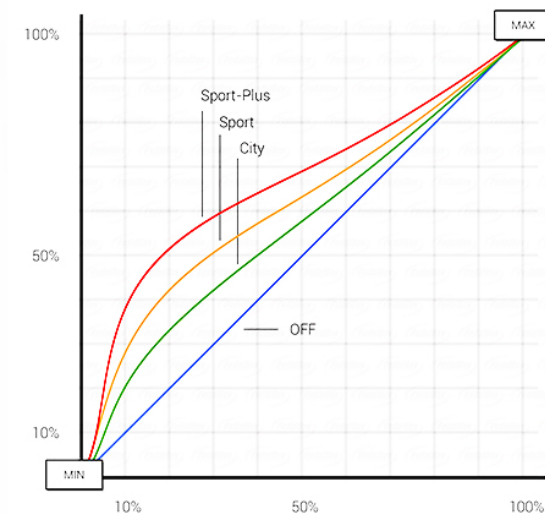

CITY (Green): Works well in and around town and on slippery surfaces

SPORT (Orange): This is the default mode and suitable for everyday driving

SPORT-Plus (Red): The quickest possible throttle response, great for the thrill seekers

Stock (White): The car is in stock mode

Once you have selected a program, you can either increase(green/plus) or decrease(red/minus) it's intensity.

How does the PedalBox work? More fun with the perfect setting for you

The following curves illustrate the speed at which the vehicle reacts to throttle input. It's not about engine power but rather the time it takes for the engine to realise that power!

Dynamite does come in small packages

Significant improvements can be felt even in the 'City' (green) mode. The 'Sport' (orange) and 'Sport Plus' (red) modes offer even more of an improvement than the 'City' mode, and all selectable by the driver.

The blue line indicates the standard responsiveness of the throttle from the manufacturer and can also be simulated by turning the PedalBox to its 'OFF' mode.

PerfectTune Automatic custom tuning for your individual car

1. Connect your PedalBox with the accelerator and get the PerfectTune programming started.
2. The PedalBox automatically analyses and auto-calibrates to your accelerator's characteristics via PerfectTune, while you are pressing down the throttle.
3. Done. All programs are now perfectly custom-tuned to your individual car.
